| Introduction | Model | Overall Results | Impact of Risk Sharing | Time Varying Risk Premiums | Conclusion |
|--------------|--------|-----------------|------------------------|----------------------------|------------|
| ●000 | 000000 | 000000 | 0000 | 000000 | |
| Motivat | ion | | | | |

- Search for a consistent framework for:
 - $\bullet\,$ Macroeconomy: match volatility and correlations for Y, I, C, W, N
 - Finance: match average and time variation of risk premiums EP and TP
- This is crucial for monetary policy making to:
 - Recover information in asset prices
 - Identify and understand macroeconomic impact of risk premiums

Representative Agent Model

Standard representative agent model cannot simultaneously match macro and finance facts:

- Empirically smooth aggregate consumption is hard to reconcile with large risk premiums (Mehra and Prescott, 1985)
- In production economy many ways to perfectly smooth consumption (e.g. investment, labor) ⇒ no compensation/premium for risk (Jermann, 1998)
- No role for income distribution risk; only aggregate risk
- Improvements to the model include Boldrin et al. (2001), Lettau & Uhlig (2000), Uhlig (2007)

Heterogeneous Agent Model

We choose heterogeneous agent model:

- Shareholders' consumption more volatile than aggregate consumption
- Risk sharing results in wage rigidity and countercyclical wage share
- Countercyclical wage share implies volatile returns to capital and high equity premium
- For earlier work see Danthine and Donaldson (2002), Guvenen (2008)

| Model Structure | | | | | | |

- Standard model with sticky prices & monetary policy
- Heterogeneous agents:
 - Limited stock and bond market participation
 - Type 1, 2 & 3 agents: Shareholders, bondholders and workers
 - Different elasticity of intertemporal substitution/risk aversion (Vissing-Jorgensen, 2002)
 - Shareholders price the assets
- Incomplete markets with partial risk-sharing through:
 - Bond trading (shareholder-bondholder) à la Guvenen (2008)
 - Efficient labor contract (shareholder-worker) à la Danthine and Donaldson (2002)

Introduction Model Overall Results Impact of Risk Sharing Time Varying Risk Premiums Conclusion

Type 1, 2 & 3 Agents

$$\max_{C_{i,t},N_{i,t}} E_0 \sum_{t=0}^{\infty} \beta^t U_i(C_{i,t}, N_{i,t}) \quad \text{with } i = 1, 2, 3$$

subject to:

| Introduction | Model | Overall Results | Impact of Risk Sharing | Time Varying Risk Premiums | Conclusion |
|--------------|--------|-----------------|------------------------|----------------------------|------------|
| 0000 | 00●000 | 000000 | 0000 | 000000 | |
| Firms | | | | | |

$$\max_{P_t(i), I_t(i), K_{t+1}(i)} E_t \left[\sum_{j=0}^{\infty} \beta^j \frac{U_{1,t+j}^C}{U_{1,t}^C} D_{t+j}(i) \right]$$

with

$$D_{t}(i) = \begin{bmatrix} \left(\frac{P_{t}(i)}{P_{t}}\right)Y_{t}(i) - \frac{W_{t}^{s}}{P_{t}}\left(N_{1,t}(i) + N_{2,t}(i)\right) - \frac{W_{t}^{c}}{P_{t}}N_{3,t}(i) \\ Labor \ contract \\ -PAC_{t}(i) - I_{t}(i) + \frac{\left(P_{t}^{B_{f}}B_{f,t}(i) - B_{f,t-1}(i)\right)}{P_{t}} \end{bmatrix}$$

subject to:

$$Y_{t}(i) = \mathbf{Z}_{t} \mathcal{K}_{t}(i)^{\theta} \mathcal{N}_{t}(i)^{(1-\theta)} - \phi = \left(\frac{P_{t}(i)}{P_{t}}\right)^{-\varepsilon} Y_{t}$$
$$\mathcal{K}_{t+1}(i) = (1-\delta) \mathcal{K}_{t}(i) + \mathcal{G}\left(\frac{I_{t}(i)}{\mathcal{K}_{t}(i)}\right) \mathcal{K}_{t}(i)$$

The wage contract solves bargaining problem:

$$\max_{C_{3,t},N_{3,t}} E_t \left\{ v_t U_1 \left(C_{1,t}, N_{1,t} \right) + (1 - v_t) U_3 \left(C_{3,t}, N_{3,t} \right) \right\}$$

subject to workers and shareholders budget constraint, and shocks to v_t (distribution risk). This results in FOC:

$$U_{1,t}^{C} = \frac{(1-v_{t})}{v_{t}}U_{3,t}^{C}$$
$$\frac{W_{t}^{s}}{P_{t}} = -\frac{U_{3,t}^{N}}{U_{3,t}^{C}}$$

with

$$\textit{Insurance}_t = \frac{W_t^c}{P_t} - \frac{W_t^s}{P_t}$$

Goods market clearing condition:

$$Y_t = C_{1,t} + C_{2,t} + C_{3,t} + I_t + PAC_t$$

Bond market clearing condition:

$$B_{1,t} + B_{2,t} = B_{f,t}$$
$$B_t^{long} = 0$$

Equity market clearing condition:

$$S_t = 1$$

Labour market clearing condition:

$$N_{1,t} + N_{2,t} + N_{3,t} = N_t$$

Monetary policy:

$$(1+R_t) = \left[(1+\overline{R})\overline{\pi} \left(\frac{\pi_t}{\overline{\pi}}\right)^{r_{\pi}} \right]^{(1-r_{\rho})} (1+R_{t-1})^{r_{\rho}}$$

| Introduction | Model | Overall Results | Impact of Risk Sharing | Time Varying Risk Premiums | Conclusion |
|--------------|--------|-----------------|------------------------|----------------------------|------------|
| 0000 | ooooo● | 000000 | 0000 | 000000 | |
| Calibrat | tion | | | | |

- Standard calibration
- Greenwood, Hercowitz and Huffman (non-separable) utility function:

$$U_{i}(C_{i,t}, N_{i,t}) = \frac{(C_{i,t} - \psi_{i} N_{i,t}^{\phi})^{1-\sigma_{i}}}{1-\sigma_{i}}$$

with $\sigma_1=$ 4, $\sigma_2=$ 10, $\sigma_3=$ 10.

Technology proces:

$$\log(Z_t) = (1 - \rho_z) \log(\overline{Z}) + \rho_z \log(Z_{t-1}) + \varepsilon_t^z.$$

• Bargaining power process:

$$\log(\textit{v}_t) = (1 - \rho_\textit{v})\log(\overline{\textit{v}}) + \rho_\textit{v}\log(\textit{v}_{t-1}) + \varepsilon_t^\textit{v}$$

US economy estimates ε^v_t and ε^z_t are correlated ⇒
 countercyclical bargaining power

• Optimal risk sharing:

$$\frac{U_{1,t}^{C}}{U_{2,t}^{C}} = \frac{U_{1,t+1}^{C}}{U_{2,t+1}^{C}} = \mu$$

- Efficient labor contract:
 - Danthine Donaldson (2002)
 - Provides optimal aggregate risk sharing, but entails distribution risk
 - No direct allocative effects
- Bond trading:
 - Guvenen (2008)
 - Provides suboptimal aggregate risk sharing due to borrowing cost

Model produces realistic average premiums. What about time variation in risk premiums?

- Need third order approximation. We use Dynare⁺⁺
- Simulate model with historical productivity and distribution shocks 1947-2007
- Obtain countercyclical time variation in the equity premium, less so in the bond premium

• Explore other sources of time variation

Predictability Regressions

- Finance literature regresses excess returns on price-dividend ratio (stocks) or yield spread (bonds)
- Countercyclical risk premiums generate predictability of excess returns

• We compare regressions on actual data and model implied data 1947-2007

Other Sources of Time Variation

- Switches in monetary policy regime:
 - Regime with inflation target a function of actual inflation
 - Less inflation fighting regime

 \implies Higher inflation volatility regimes produce higher TP

- Changes in volatility of shocks (Great Moderation):
 - Break date 1984:4
 - 20% decline in distribution risk
 - 50% decline in productivity risk
 - Equity premium falls from 6.4% to 2.0%
 - $\bullet\,$ Term spread falls from 2.1% to 0.6%

| Introduction | Model | Overall Results | Impact of Risk Sharing | Time Varying Risk Premiums | Conclusion |

| Conclus | ion | | | | |

Heterogeneous agent model with distribution and productivity risk:

• Macroeconomic dynamics:

• Match volatility and correlations for Y, I, C, W, N

- Finance:
 - Match average risk premiums SR, EP, TP
 - Match predictability regression equity
 - Matching predictability regression bonds remains a challenge
 - Potential role for shifts in monetary policy and distribution and productivity risk
